

OS Security Audit & Upgrade Plan: Active Directory Controller

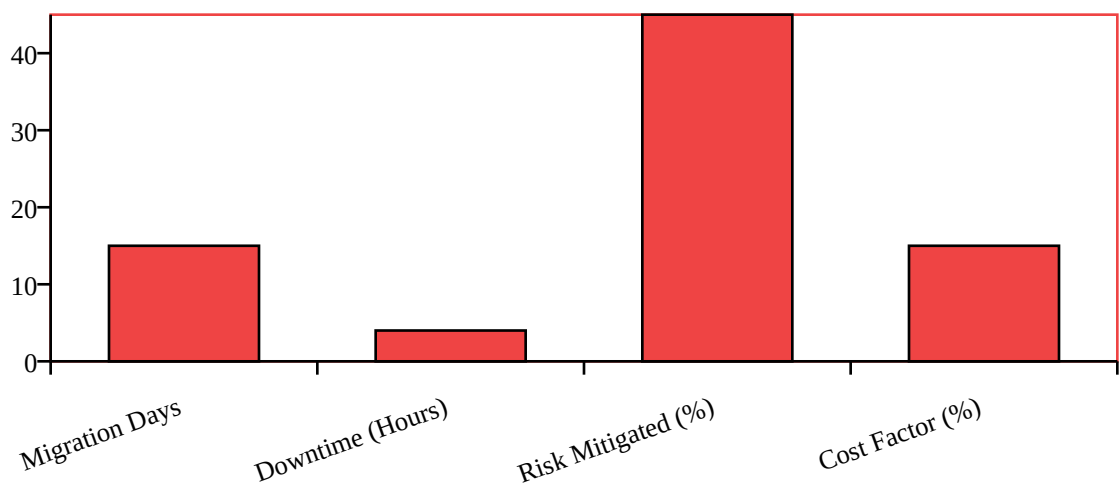

Generated on 2026-07-31 15:28:16

Executive Summary

This audit evaluates Active Directory Controller operating under Windows Server 2022. As of the current year 2026, the OS release year was 2021 (gap of -5 years), leading to a deficit of approximately 60 missed security patches. The server exhibits an OS Security Score of 19% and requires immediate upgrade planning to achieve post-quantum defense readiness.

OS Security Score	19%
Patches Deficit	-60 patches
Year Model Diff	-5 Years
Upgrade Profile	High Effort

Upgrade Complexity KPIs

Vulnerable Assets

Asset Name	Algorithm	TLS Version	Status
Active Directory Controller	Windows Server 2022	Deficit: 60 patches	Critical

Actionable Recommendations

- Upgrade plan: migrate from Windows Server 2022 to Windows Server 2026.
- Est. migration duration: 15 developer-days. Planned downtime window: 4 hours.

- Rollback Mitigation Plan: Restore primary AD metadata state from physical backup system and hold sync replicates.
- Resolve known compatibility concerns prior to update: Legacy LDAP bindings, NtlmV1 compatibility requirements, Older domain controller trust replication
- Critical Attack Vectors To Prevent: IPv6 Remote Code Execution (RCE), Remote Desktop Licensing Service RCE, Active Directory Authentication Bypass
